

Soak the pot in a bucket of water until the soil is moist.

Cut off the bottom the pot and make a perpendicular cut up the side.

Dig a hole about twice as wide and 2" deeper than the pot. Backfill 2" of soil mixed with bone meal to the hole.

Place the rose in the hole and make sure the bud union is about an inch above the soil line. Then remove the pot.

Next, water the plant's root ball and the surrounding soil in the hole. Add some soil to the hole and a little more water.

Firm the soil around the rose's root ball. Add more soil and water thoroughly after all the soil is replaced.

Firm the soil around the rose and mulch. After planting the rose, it's important to water regularly.
